Rotary valves HRE 3, HRE 4

Description

Danfoss HRE rotary valves are primarily designed for regulation of flow temperature in heating systems where a certain leakage can be accepted and where a defined control characteristic is not required.

HRE rotary valves can be used in combination with electric actuators AMB 162 and AMB 182.

Features:

- Cast iron body with internal thread
- Lowest leakage in class
- Unique position indicator (visible also when actuator is mounted)
- Ergonomic handle
- For mixing and diverting applications
- Internal thread connection

Main data:

- DN 20–50
- k_{vs} 6.3–40 m³/h
- PN 6
- t_{max} =110 °C
- 3-way or 4-way
- S characteristic

Installation

Valve mounting

Before valve mounting pipes have to be cleaned and free from abrasion. Mechanical loads on valve body caused by the pipes are not allowed. It is recommended to install a strainer into application to avoid damaging controlling components.

Connection

HRE 3 can be used as a mixing valve, diverting valve and in connection with heat exchangers where a certain leakage can be accepted.

HRE 4 operates according to the double shunt principle i.e. the water from the boiler is mixed with a certain portion of the water in the return. In this way the water which goes to the boiler reaches a higher return temperature than by using 3-way valves. This means that the risk of corrosion in oil and solid fuel boilers is reduced.

Disposal

The valve must be dismantled and the elements sorted into various material groups before disposal.
